To ensure that sufficient contrast of colour is achieved for critical surfaces that are adjacent to one another, we can look at Light Reflectance Values (LRVs). It is recommended that there is a difference of around 30 points between the LRVs of colours selected for these surfaces. The Johnstone's fan deck states LRVs to help you in your colour selection. Although every effort is made to ensure accurate colour representation, due to the limitations of the printing process, the colours shown on this page may not be true representations of the actual colours and are meant as a guide only.
